### **ABSTRACT**

The transparency and flow of information play a significant role in functioning of future market. The efficiency of price discovery of future market depends on the continuous flow of quality information and transparency. The transparency depends upon the information symmetry and level of infrastructures (UTCTAD 2009). The effective calculation of commodity index is also very important. Rath (2009) in his work emphasizes the difficulties in the computation of commodity index. Computation of an effective commodity index is far more difficult and cumbersome work. The price of a commodity of a particular variety/standard is not readily available. The information which is ready is not sufficient. There is also imbalance in the representation of agricultural product vis-à-vis manufacturing items. An ill computed index can cause serious damages to the market sentiment.

**KEYWORD:** Commodity index, Computation, imbalance, market sentiment
