### ABSTRACT

Population Census 2011 of Indian demography is alarming, what can be the census results in 2101 A.D., 2201 A.D. and 2301 A.D. that is the top priority concern of the policy makers strategists the economists of the country, seems untrue, that's the concern in the biggest form every citizen. Environment management towards a sustainable development along with the food and agricultural products with eco-friendly strategies is the clarion call of the time. Food for the growing population needs to be produced in the ample marine resources of India and technology needs adequate development to sustain the development and growth of the population. Future nutrition and food of India will come from the aquaculture, which will substantially replace the agriculture on the land surface. The current trend of aquaculture food is growing at a rate which is more than hundred percent per decade. High production and organic production with planned culture of aqua-food will provide future sustainability for the world's most populous country that has 8118 km long coastline and 2.02 Million sq. Km (EEZ) Exclusive Economic Zone. Some prime issues are examined and in the light of the environment management and food paradigm perspective.

**KEY WORDS:** Fishery, Water Pollution, Organic Production, Eco-friendly, Fish Catch, Fish Culture, Aquaculture
