ABSTRACT:

the nature of community health problems widely varies from one region to another, depending upon the Bioclimatic conditions and the prevalence of various diseases and disorders in these regions. In the developing cities in India especially in Andhra Pradesh lack of health surveillance programmes has poor understanding of the community health problems and there by health care planning still remained as major problem. Slums are neglected parts of the cities where housing and living conditions are applying lacking. Slums range from high density, squalid central city tenements to spontaneous squatter settlements without legal recognition or rights, sprawling at the edge of city. Some are more than Thirty years old and some other land invasions jest under way. Among the different types of habitations, slums are the worst sufferers, where Community health is neglected both by the public and state. In this study analyzed the predominant and Incidence effected diseases among selective slums Visakhapatnam city.

KEY WORDS: Habitations, Incidences, Predominant, Surveillance, Sprawling
