ECONOMIC RICKETS SYNDROME AND RESOURCE FLOW MANAGEMENT

SURESH KUMAR TAMADA

ABSTRACT
The economic function had often been perceived as a subject which is based on the pulls and pushes of the demand for a particular product or service and the supply situation and at a more macro level, the aggregate demand. But then there are many known and unknown or random factors which come into play to determine the economy, particular to a demographic and socio-political situation. The economic situation could be perceived essentially as the barometer of resource flow and the need, which determines the health and affluence of a particular demarcated economic centre. The economy could function more smoothly when it is in based on strong foundations of a good resource-oriented approach. Particularly, the flow of resources need to be optimized to keep off the disabilities, by means of lack of proper movement of resources which could lead to an economy being wayward, sometimes even with considerable affluence. This is termed as ‘Economic Rickets Syndrome’.
